## Changes made in MSS version 5.40

Revised December 13, 2005

### System Wide Update Information

Modified programs to be compatible with PFW 5.4.
Modified the way distributed costs is calculated in Inventory Quantity Correction when there are accrued receipts.

### Production Floor Tracking Update Information

New program – Work Center Capacity Maintenance allows the user to specify work center capacity by day.
Allow the “Scrap” column in BOM Maintenance to be “Extra Days” for work center components.
Job List was modified to show job status by work center.
New program – Scheduled Work Center Report shows the days each work center of each job is scheduled to be run.
New program – Schedule Process Cells allows the user to identify a BMPFW job (see BOMP updates) to be scheduled.
New program – Import Batch Process from BMPFW. This updates the status of the BMPFW jobs to show their current status on the production floor.

### BOMP Update Information

Ability to do a component lookup (in BOM Maintenance) by Manufacturer Part Number.
Add the ability to copy serial numbers from a component to the finished good item – in Transaction Entry.
New variance report. This is more cost oriented than our original variance report.
Printing of standard text is now optional in the Transaction Status report, Production Work Order report, and in the BOM Posting reports.
BOM Maintenance now allows jobs to be flagged as BMPFW jobs. These jobs will allow a new component source – process cells from BMPFW. These jobs are used in our PFT module to track BMPFW jobs that go through multiple process cells.
Modify the Complete Job transaction for the new BMPFW job, so that inventory is not updated. The job is marked as completed in the PFT module.

### AR to PC Update Information

Added six programs which give this module the ability to calculate sales commissions by project. This involves specifying multiple sales people and associated commission percentages for each project.
